^1H NMR of fluorinated systems

The analysis of fluorine-containing systems is an ongoing challenge in ^1H NMR.

- ✓ Structural information from δ_{H}
- ✓ $|J_{\text{HH}}|$ couplings ranging from 0 - 25 Hz
- ✓ $|J_{\text{HF}}|$ couplings ranging from 0 - 60 Hz

- ✗ Severe signal overlap
- ✗ Poor spectral resolution

^1H NMR of fluorinated systems – ^1H vs ^{19}F NMR

^1H NMR

More structural information

Severe signal overlap

Poor spectral resolution

^{19}F NMR

Less structural information

Less signal overlap

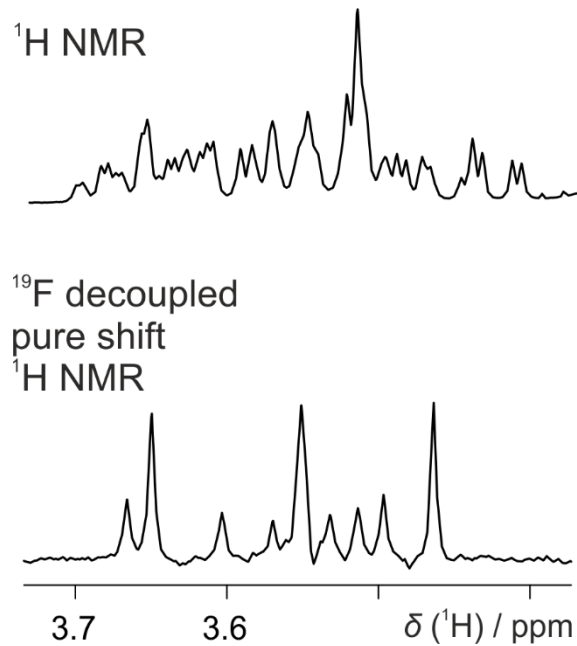

Good spectral resolution

For ^{19}F -containing complex systems, we need more sophisticated and problem-specific methods

Overcoming signal overlap in ^1H NMR in ^{19}F containing systems

Extraction of δ information

Heteronuclear pure shift ^1H NMR

Extraction of individual spin system δ information

Pure shift FESTA

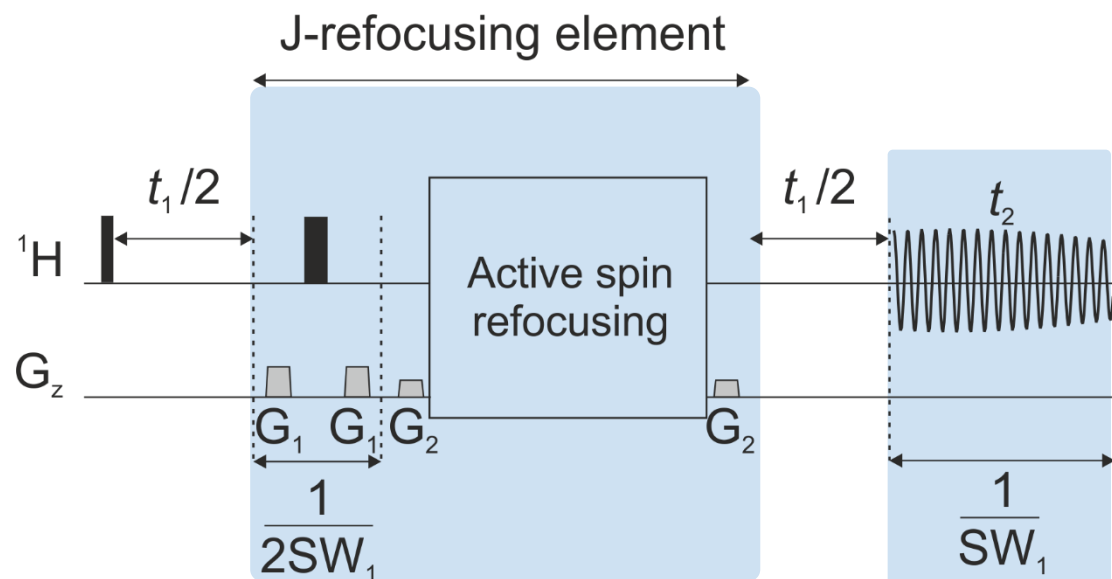

Extraction of the signs and magnitudes of J_{HF} couplings

IPAP - FESTA

Pure shift ^1H NMR with interferogram acquisition

Pure shift methods collapse multiplicities originating from J_{HH} couplings
Chemical shift and J_{HF} coupling information can be extracted

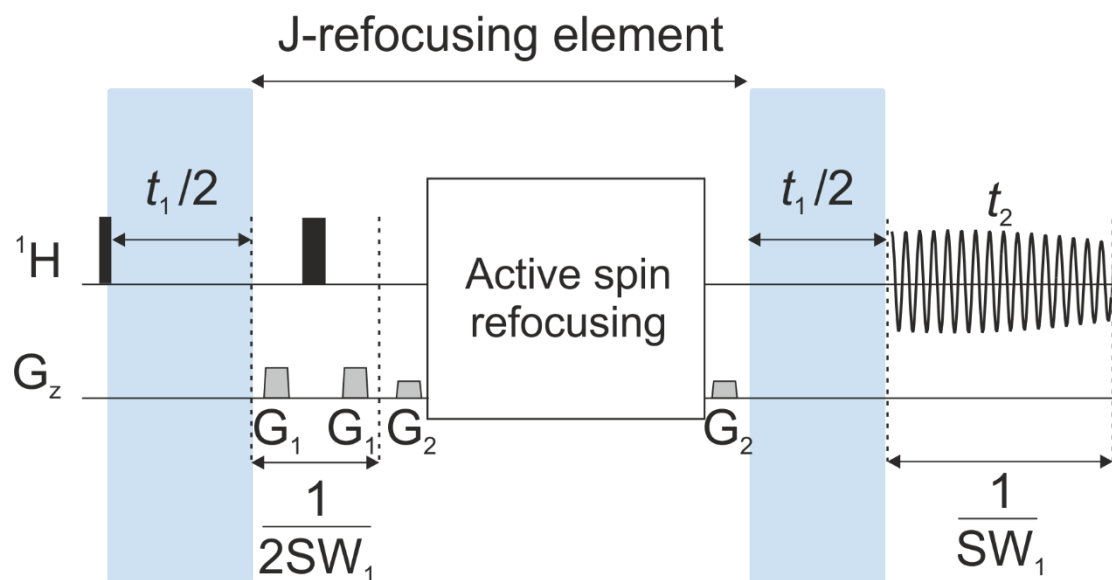

Active spin refocusing element:

	Band-selective	BIRD	Zangger-Sterk	PSYCHE
^1H				
^{13}C				
G_z				
Relative sensitivity to ^1H NMR	$\geq 100\%$	1.1%	0.5 - 20%	3 - 20%
Broadband?	✗	✓	✓	✓

- J-refocusing element ensures J_{HH} coupling is refocused at $t_2 = 1/(2SW_1)$ whilst allowing δ to evolve
- $1/SW_1 \ll 1/J_{\text{HH}}$ to minimise J_{HH} evolution during the chunk

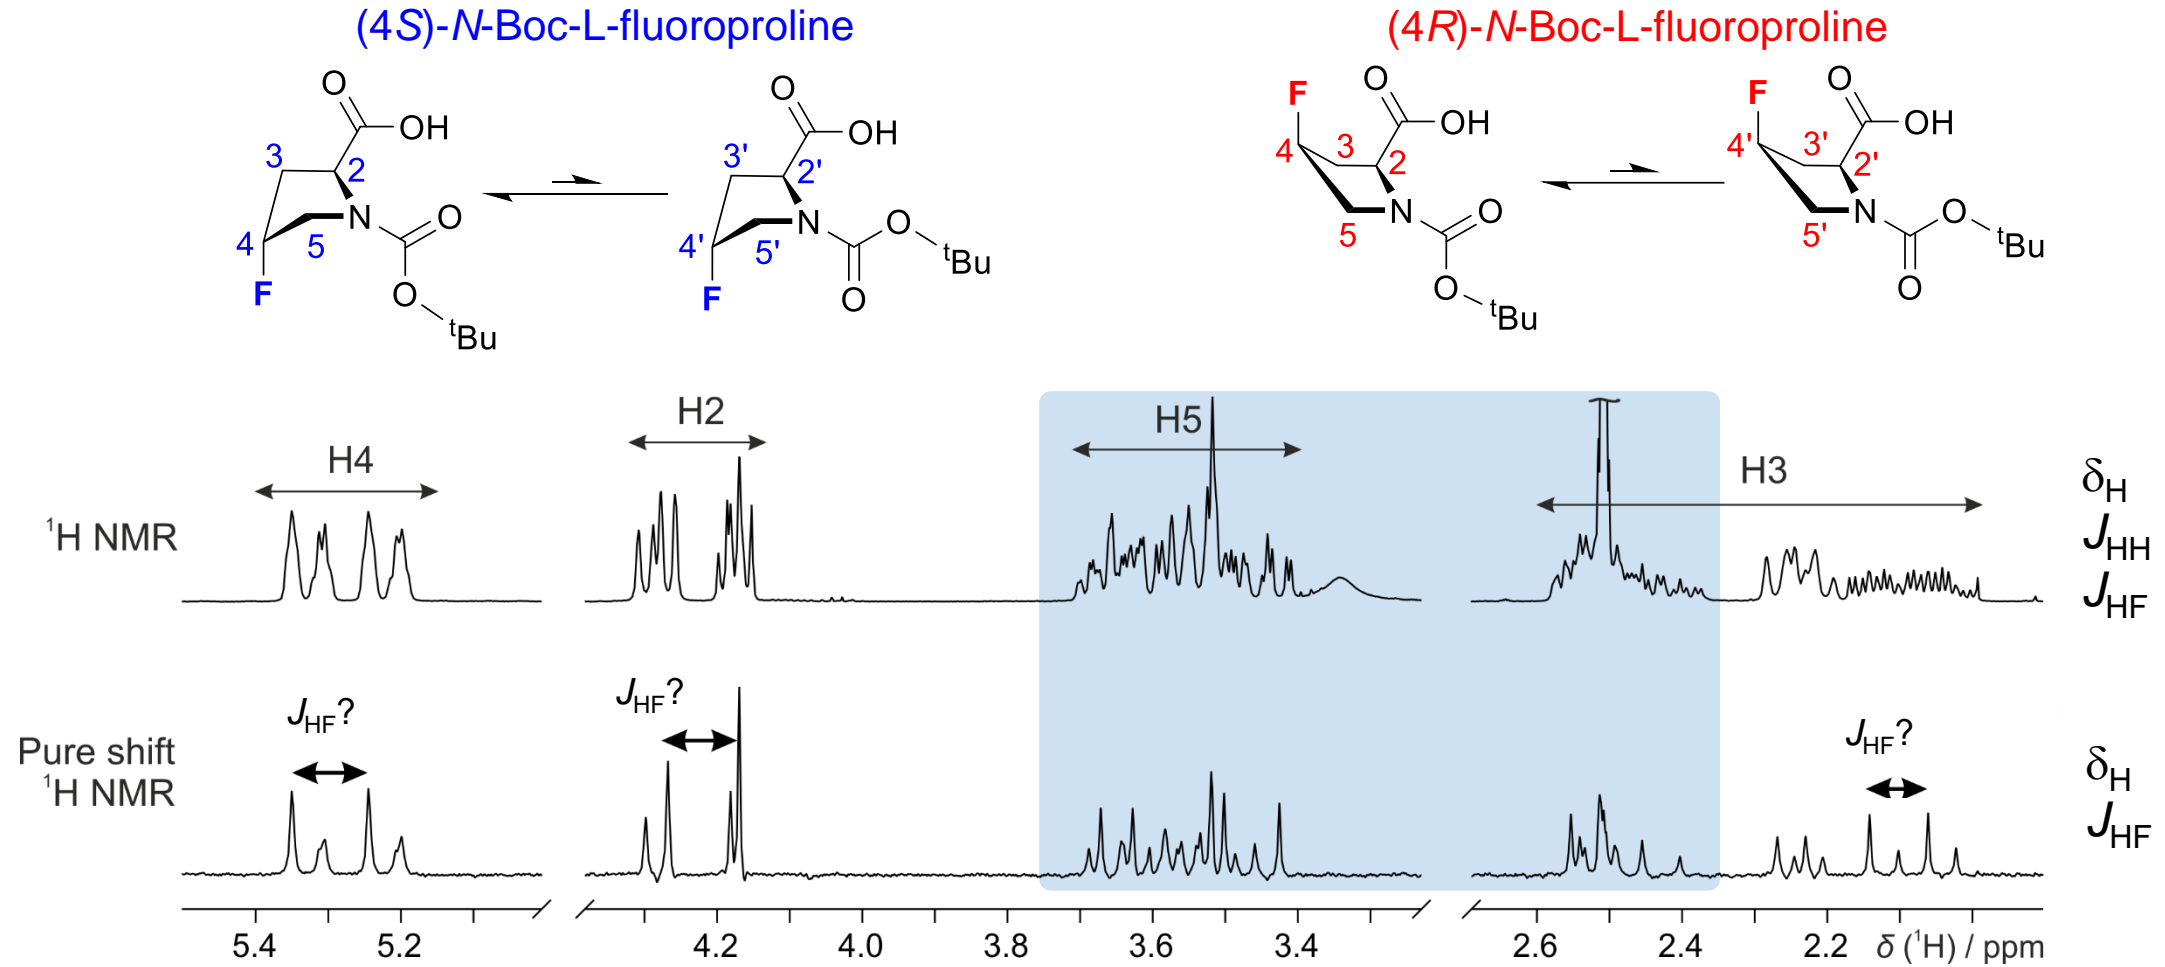

Pure shift ^1H NMR with interferogram acquisition

- J-refocusing element: ensures J_{HH} coupling is refocused at $t_2 = 1/(2SW_1)$ whilst allowing δ to evolve
- $1/SW_1 \ll 1/J_{\text{HH}}$ to minimise J_{HH} evolution during the chunk
- t_1 : incremented delays as a multiple of $1/SW_1$

Pure shift ^1H NMR with ^{19}F containing systems

Pure shift methods partially simplify the spectra of ^{19}F containing systems

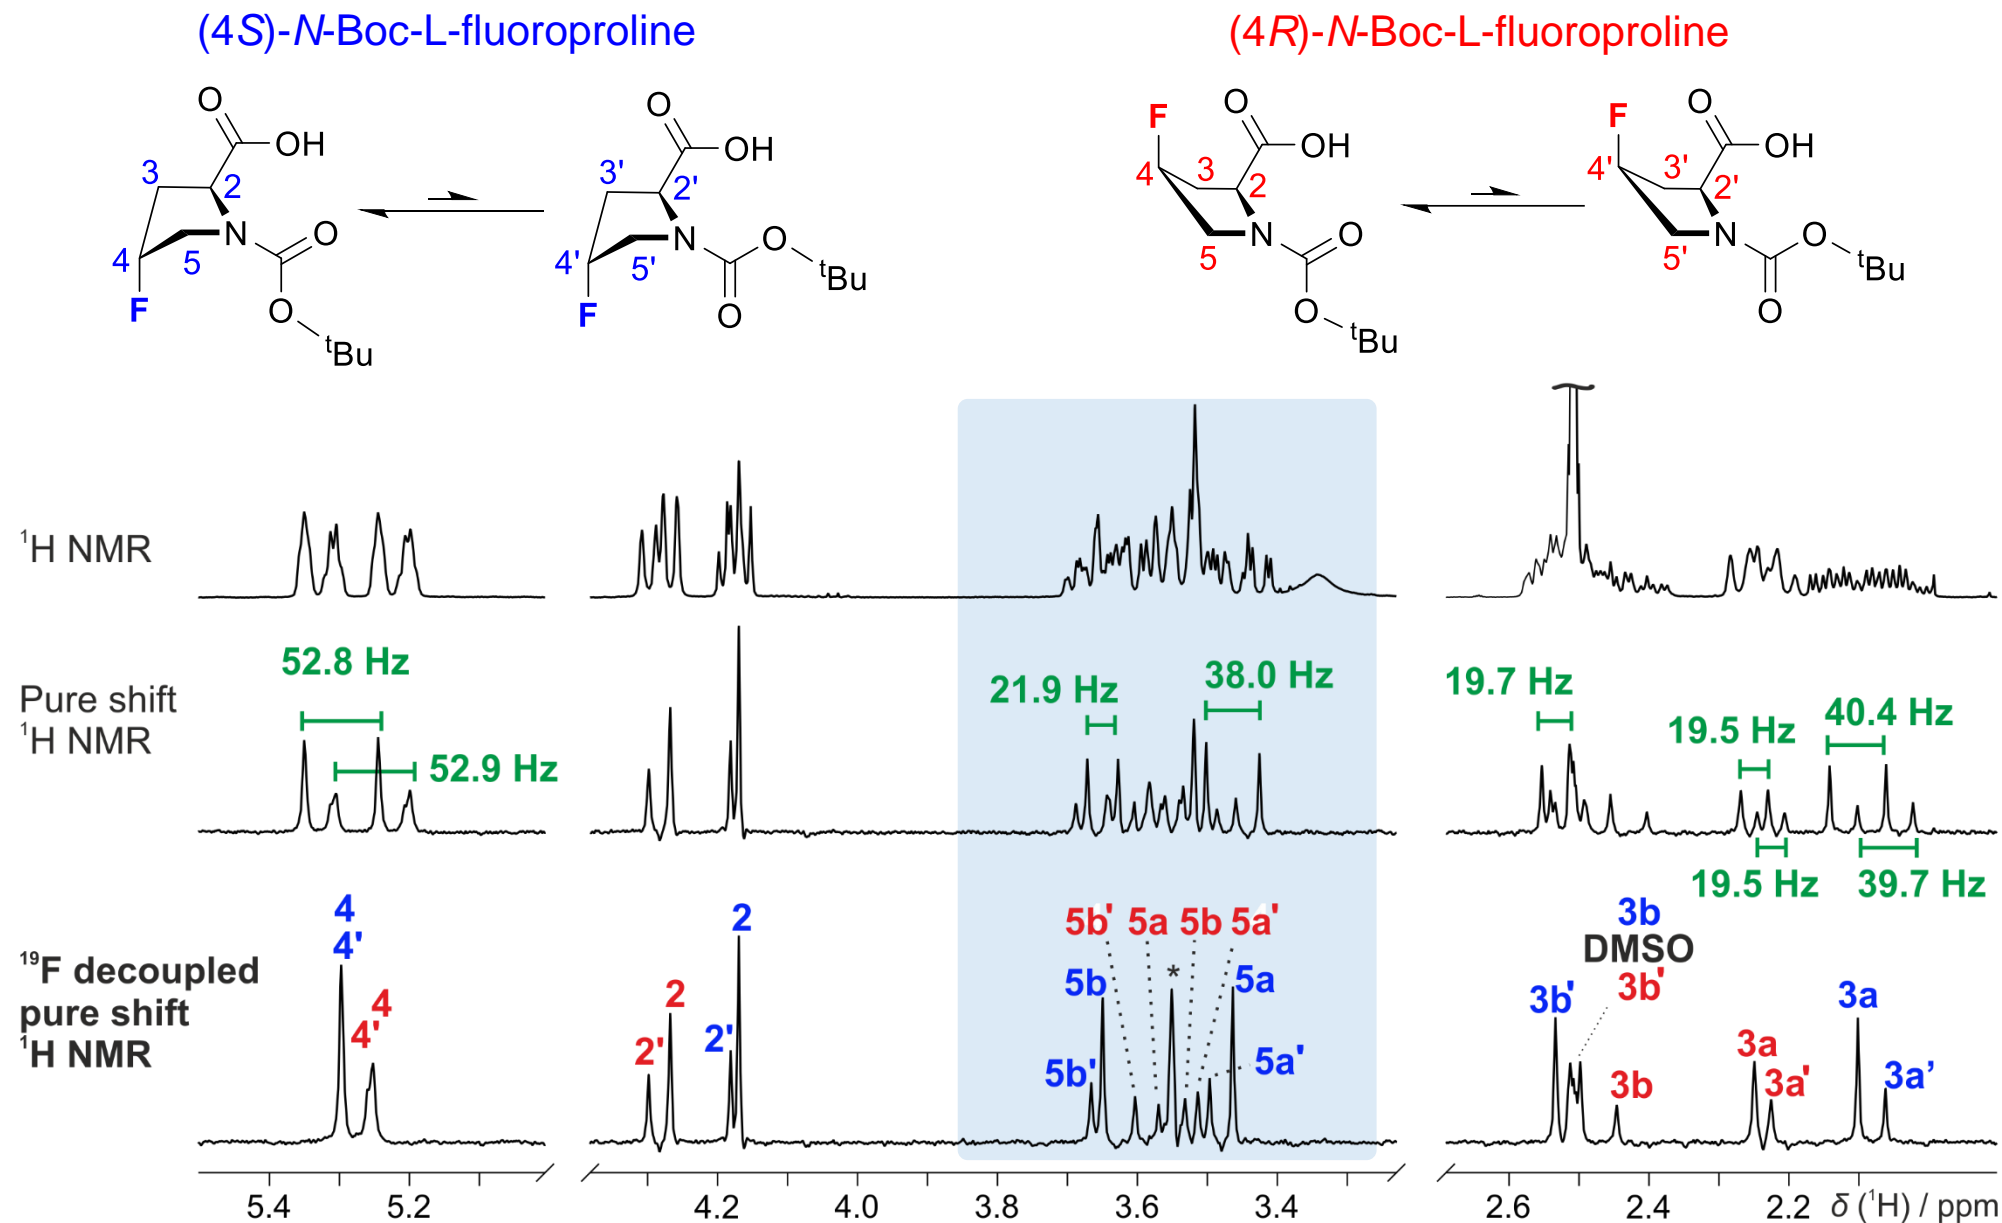

? Chemical shift information ? J_{HF} information **X** Signal overlap due to J_{HF} couplings

Heteronuclear decoupled pure shift ^1H NMR with interferogram acquisition

- Apply broadband adiabatic 180° pulses at the midpoints of the $t_1/2$ delays
 - Refocuses J_{HF} couplings at the beginning of the acquisition
 - Adiabatic pulses ensure all ^{19}F resonances are inverted
- Adiabatic heteronuclear decoupling during acquisition
 - J_{HF} couplings remain inactive during acquisition, independent of magnitude or ^{19}F chemical shift

Heteronuclear decoupled pure shift ^1H NMR

Heteronuclear decoupled pure shift ^1H NMR

(4*S*)-*N*-Boc-L-fluoroproline

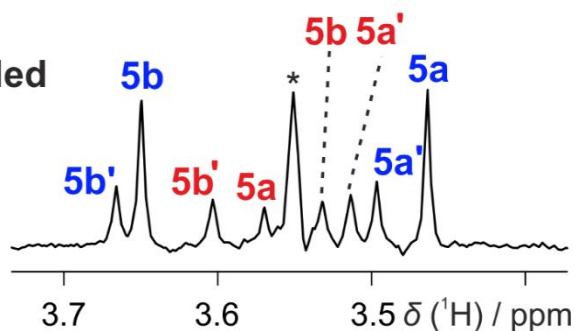

^1H NMR

Pure shift
 ^1H NMR

^{19}F decoupled
pure shift
 ^1H NMR

(4*R*)-*N*-Boc-L-fluoroproline

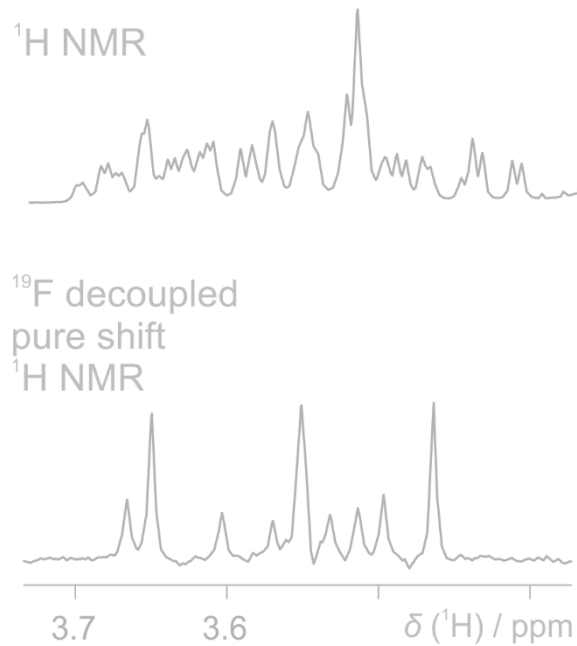

- ✓ One singlet per chemical environment
- ✓ Drastically reduced signal overlap
- ✓ Improved resolution
- ✓ No increase in experiment time compared to pure shift ^1H NMR

* Strong coupling artefact for **5a** and **5b**

Overcoming signal overlap in ^1H NMR in ^{19}F containing systems

Extraction of δ information

Heteronuclear pure shift ^1H NMR

Extraction of individual spin system
 δ information

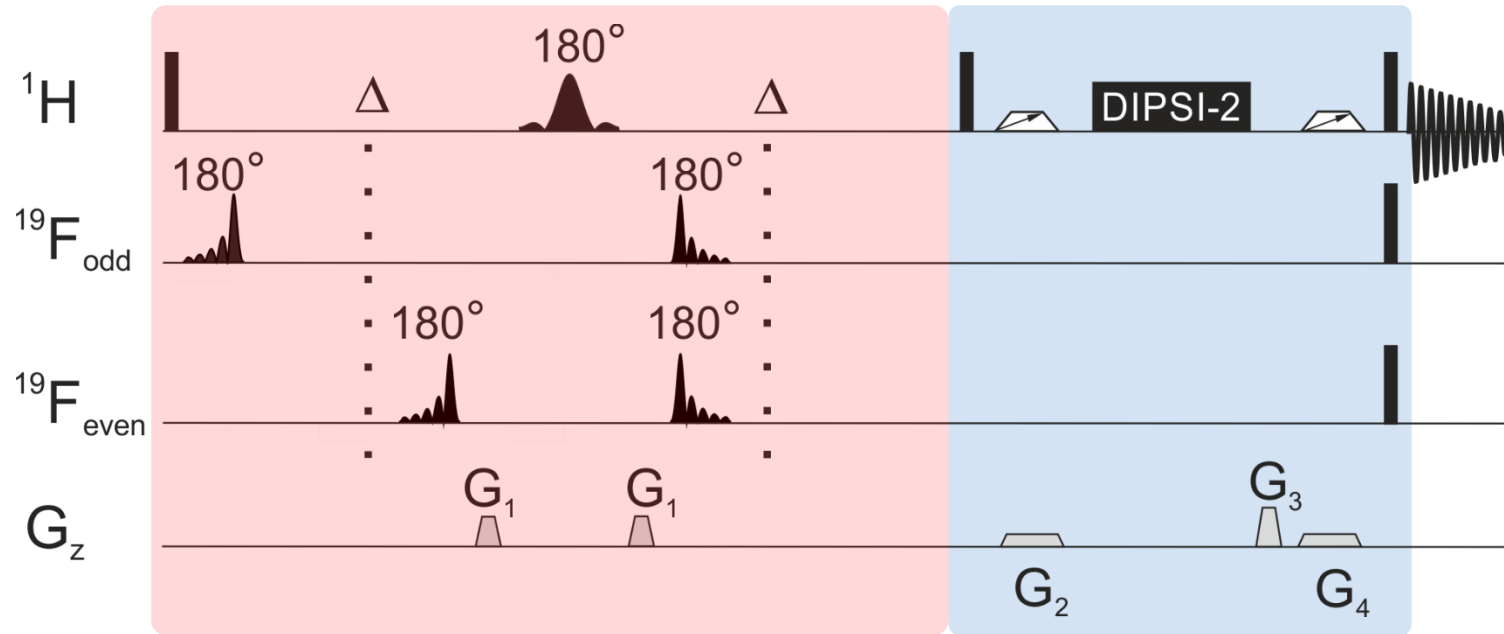

Pure shift FESTA

Extraction of the signs and
magnitudes of J_{HF} couplings

IPAP - FESTA

MODulated echO Fluorine-Edited Selective TOCSY Acquisition

Selective modulated echo

Selected ^{19}F coupled
 ^1H signal only
(all other signals suppressed)

TOCSY

Transfers magnetisation
throughout spin system

MODO-FESTA – Photodegradation study

UV light
(15 hr)

^1H NMR

^{19}F NMR

MODO

MODO-FESTA

Pure shift MODO-FESTA

Selected ^{19}F coupled ^1H signal only \longrightarrow Transfers magnetisation throughout spin system \longrightarrow Suppression of the effects of J_{HF} and/or J_{HH} couplings

Pure shift MODO-FESTA – Photodegradation study

UV light
(15 hr)

^1H NMR

MODO-FESTA

Pure shift
MODO-FESTA

^{19}F decoupled
pure shift
MODO-FESTA

Lumibetamethasone

Overcoming signal overlap in ^1H NMR in ^{19}F containing systems

Extraction of δ information

Heteronuclear pure shift ^1H NMR

Extraction of individual spin system
 δ information

Pure shift FESTA

Extraction of the signs and
magnitudes of J_{HF} couplings

IPAP - FESTA

IPAP methodology - Extracting J_{HF} coupling constants

IPAP: In-Phase Anti-Phase

Allows the $^{19}\text{F} = \alpha$ and $^{19}\text{F} = \beta$ components to be obtained in separate spectra

Fast and easy determination of the signs and magnitudes of J_{HF} couplings

IPAP-FESTA - Extracting J_{HF} coupling constants

- 4 variations of the modulated echo
 - Differing ^{19}F pulse timings in the modulated echo
- 2 scans: IP-MODO-FESTA
- 2 scans: AP-MODO-FESTA

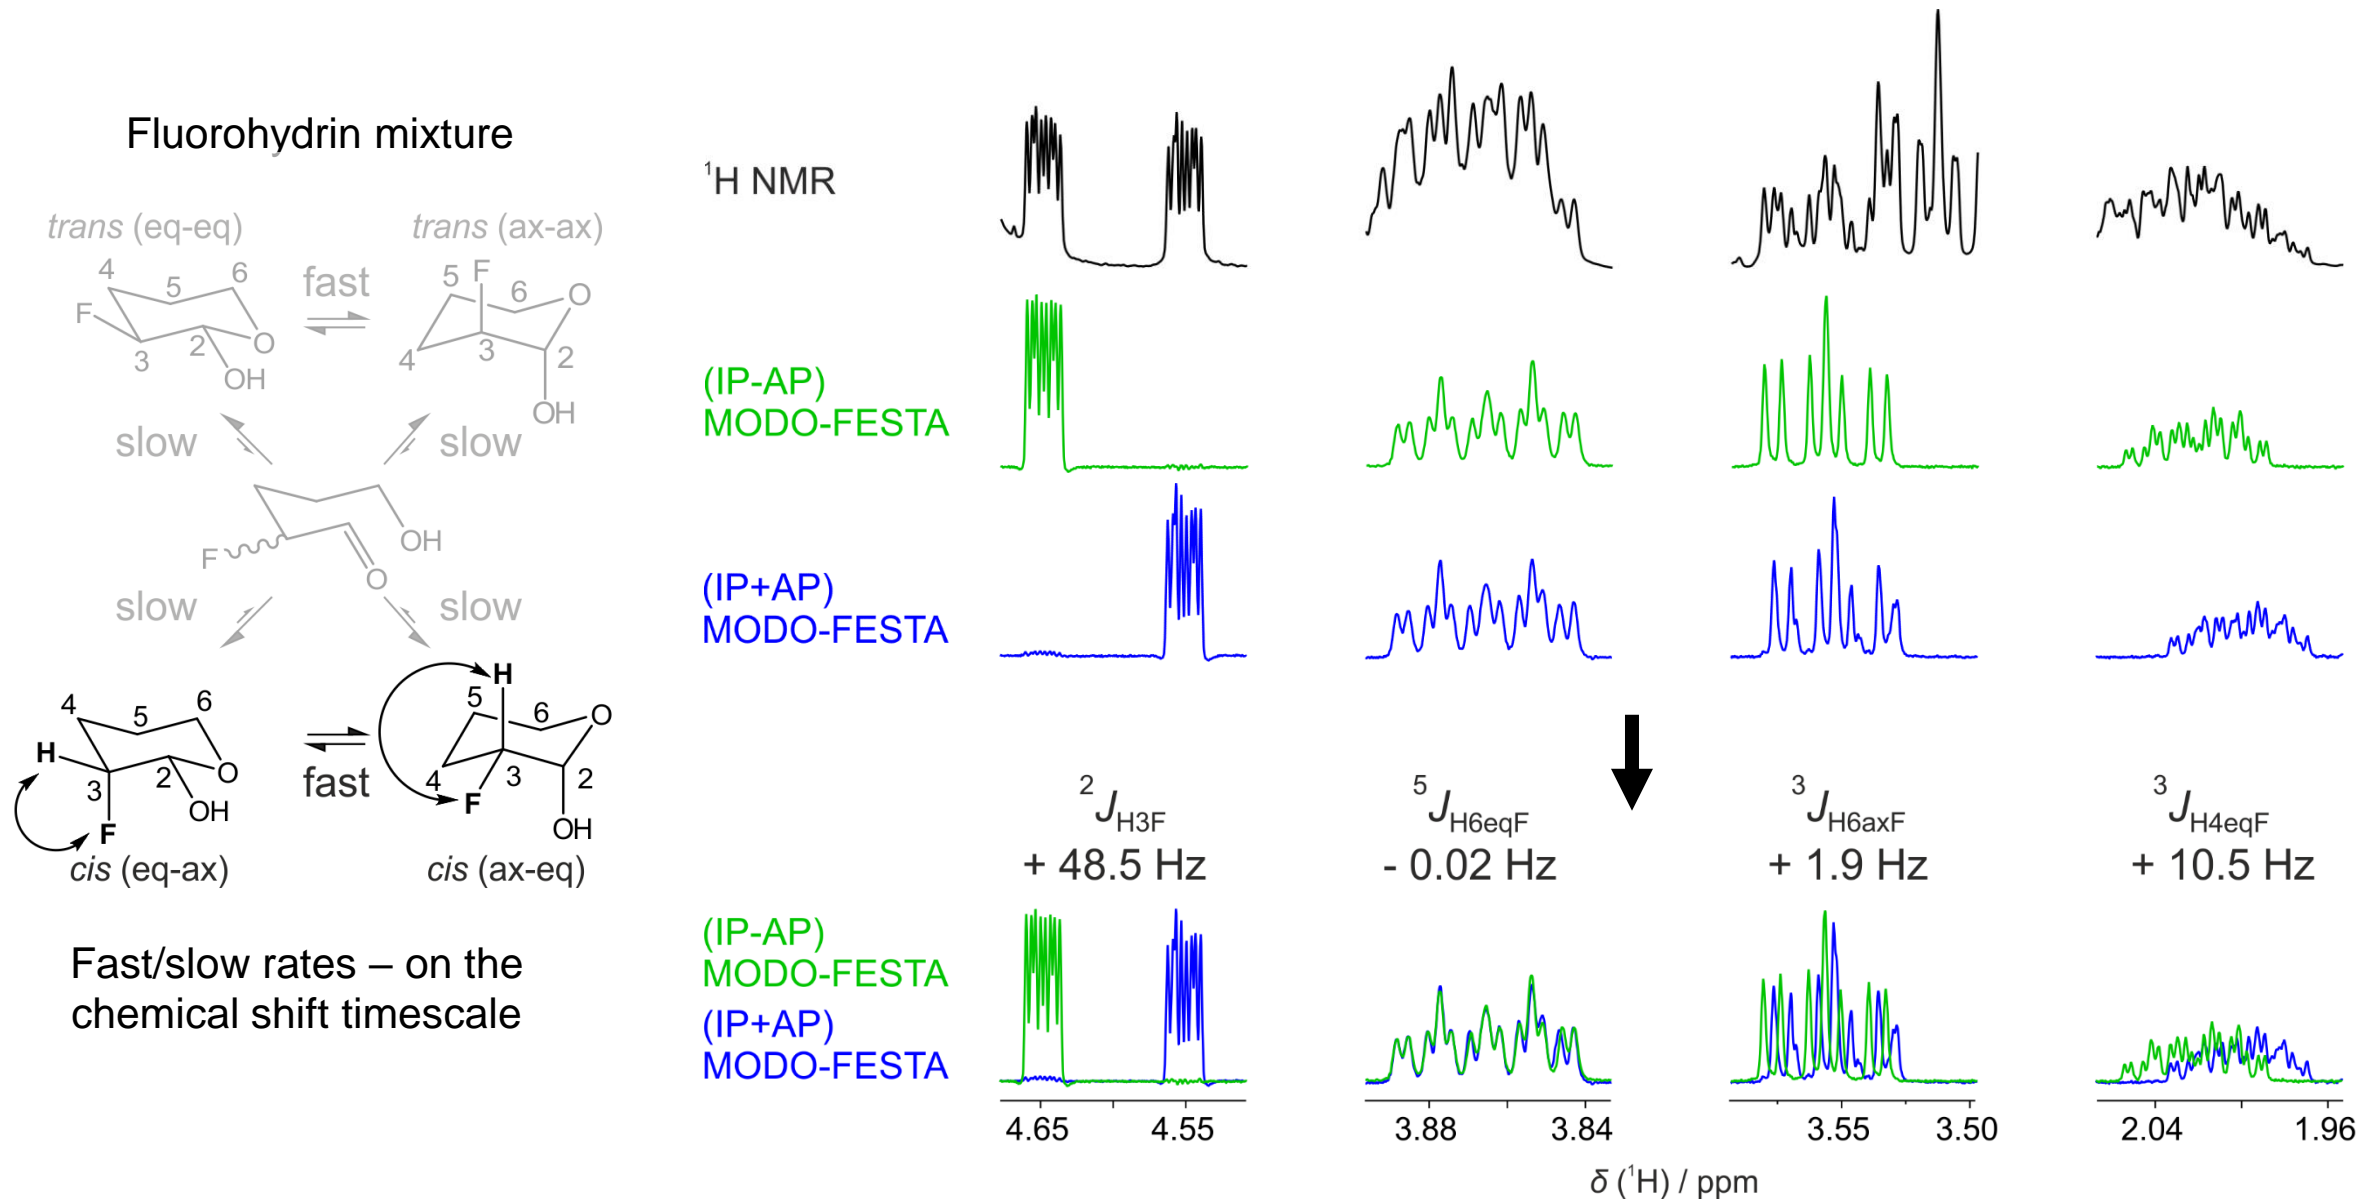

IPAP-FESTA - Extracting J_{HF} coupling constants

Fast/slow rates – on the chemical shift timescale

IPAP-FESTA - Extracting J_{HF} coupling constants

Summary: New NMR methods for structural analysis of fluorinated systems

Extraction of δ information

Heteronuclear pure shift ^1H NMR

Extraction of individual spin system δ information

Pure shift FESTA

Extraction of the signs and magnitudes of J_{HF} couplings

IPAP - FESTA

These methods are also applicable to other NMR active nuclei such as ^{31}P

Pulse Sequences

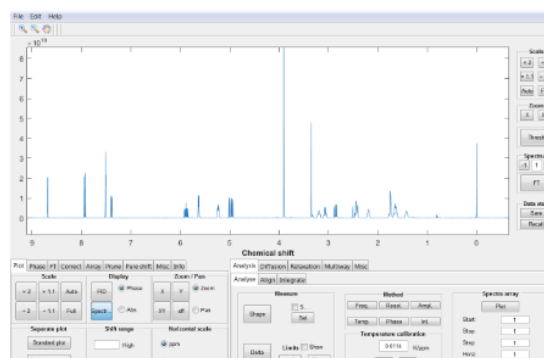

We are currently preparing many of our pulse sequences, parameter sets, example datasets and processing macros for the website. Some are available [here](#) but if you would like to use any of the other the sequences, as described in the [publications](#) section, please email us. The majority of sequences are available for Varian systems and we are gradually writing the Bruker variants.

The pulse sequences and any macros required for data conversion can be accessed from [this](#) part of the website.

Software

Software produced in-house, including [The GNAT \(General NMR Analysis Toolbox\)](#), the legacy [DOSY Toolbox](#), and [diffusion estimation](#).

Workshops and presentations

The slides from some of the workshops and presentations given by group members are available from [this](#) part of the website. There is a pure shift NMR package available for download as part of our 2017 [workshop on pure shift NMR](#).
